TWENTY-SECOND ANNUAL REPORT

OF THE

TRUSTEES OF THE STATE LUNATIC HOSPITAL.

AT WORGESTER,

1854.

To His Excellency the Governor and the Honorable Council:-

In compliance with law and custom, the undersigned, Trustees of the Massachusetts State Lunatic Hospital at Worcester, present their Annual Report of "the condition of the hospital and its concerns."

Under ordinary circumstances, this Report might well be very concise, and confined to a summary of the principal events of the year. But in the actual state of the case; in the present condition of the question concerning the provisions to be made for the insane of the Commonwealth; and in the prospect of legislative action upon the whole subject, greater diffuseness may be allowed.

In setting forth the condition of the Hospital, and the remedies for its defects, it will be necessary to examine certain principles and modes of treatment, which, though familiar to professional, are not so to unprofessional readers. Arguments that would be held superfluous; considerations that would be deemed perfectly trite by a body of physicians, may be appropriately addressed to those whose studies and occupations have not familiarized them with the subject of insanity,

but who may be called upon to take measures for the cure and care of the insane of the State.

The year has been one of general health and prosperity. No epidemic has occasioned unusual mortality in the Hospital; no fatal accident has broken the usual quiet of the household; no manifest abuse of trust has lowered the high character of the body of officers and attendants.

However far short the Institution may have fallen of doing the greatest possible good with its means, it certainly has continued to carry on, with marked success, the work of Christian charity allotted to it by the State; and another year of good deeds may be added to its history of beneficence. That history has been glorious in the best sense; and Massachusetts may reflect upon it with as much satisfaction as upon any part of her annals. Had she erected at Worcester a Military Academy and an Arsenal, from which to draw men and weapons to conquer in a hundred fields, she could not have won such precious laurels as she has earned within these walls.

Since the opening of this Hospital, four thousand seven hundred and fifty-seven insane persons have been received within its friendly gates. Of these, two thousand one hundred and seventy-two have gone forth again clad in their right minds, or have partially recovered. Others, secluded from the world, (which to them was one of excitement and suffering, while to it they were a terror and a burden,) here pass their days peacefully, and receive that respectful attention due to every being in human shape, however ruined and degraded he may be; and those to whom the end comes, have their eyes gently closed in death by friendly hands. Nor have these only been benefited; for thousands upon thousands of relatives and friends have been relieved from dreadful anxiety, by the State thus taking charge of those beloved ones for whom they could do nothing.

Nor yet have benefits and blessings been conferred upon these the receivers only, but the giver too has been doubly blessed; and Massachusetts has been made richer in the heart's treasures for every year in which, from its high pulpit at Worcester, the Hospital has preached to all the people its daily sermon of Christian love and charity.

The Trustees have great pleasure in such retrospect; and

they heartily ascribe the praise for that portion of the good work which has been accomplished during the past year, to the Superintendent, his assistants, and the faithful men and women in attendance, by whose immediate agency it has been effected.

It is easy and pleasant to render merited praise. It is agreeable to indulge in complacent retrospect of past efforts and acknowledged excellence. But it is a duty to be mindful of faults and shortcomings. It must not be admitted that any thing which has been done in the past, or any success which has been obtained, can warrant a moment's pause in that long career of improvement which is clearly open before this Hospital. That career, indeed, must be pursued with unwonted zeal and energy, if the character which its friends once claimed for it, of being a model institution, can be regained and deserved.

This Hospital was once indeed a model one, in form and in administration; and Commissioners came up hither from other States to study it, and went home to copy it. Our State felt a reasonable pride in the Institution, and in that remarkable and eminent man who so long ministered it; and she indulged in not a little self-gratulation from year to year. It seemed to be thought that, as we had begun with the country's highest achievement, we had also arrived at the ultimatum of the world's possible progress. But while indulging in these pleasant remembrances of the past, and resting on our laurels, great improvements were made elsewhere; other hospitals were built on better models; other and better principles of administration were adopted, until now we find ourselves behind the rest of the world in respect to the facilities and the means which we give to those who have the care of our insane.

It is well known that during the last quarter of a century, and especially during the last ten years, close observation and study of the phenomena of insanity, in Europe and in this country, have thrown fresh light upon its pathology, and caused this light to be so widely diffused that changes and improvements, amounting to revolutions, in the mode of treating the insane, have been demanded and obtained. These changes and improvements have been, as it were, of a moral nature; merely causing the substitution of moral for material agencies, in the administration of hospitals; yet they

required improved buildings, grounds, and material appliances of various kinds.

The improvements in the art of manufacturing cotton cloth have been so great within a quarter of a century, that a factory which possessed only the machinery provided for it twenty-five years ago, could not be run successfully in competition with new No ability or resource of its directors, no skill or zeal of its agent, no fidelity or industry of its workmen, could enable it to do as much or as good work as its more modern competitors. Now, a hospital for the insane is an establishment for repairing health of body, and, through this, health of mind. It is a place for repairing disordered men. It should possess the best machinery, and the best of officers to work it. The principal part of the machinery is the building, and its importance is immense. It should not merely serve to house the patients and protect them from the weather; but it should afford the greatest possible facility for applying the best mode of treatment, by its situation, its construction, its conveniences, its furniture, and its various means of occupation and amusement within; and by its gardens, its grounds, and its contrivances and allurements to exercise and labor without. Lacking these advantages, no ability or resources of its trustees; no skill or zeal of its superintendent; no fidelity or industry of its attendants, can ever enable it do so much or so perfect works of cure as other institutions that possess them.

But when, besides the lack of these advantages, a hospital is overcrowded with patients; when it is obliged to huddle together over five hundred and fifty persons in apartments constructed for only three hundred and twenty-seven, and constructed, too, when less space was thought to be requisite than is now found to be essential; when, moreover, the patients, instead of being partly drawn according to the original purpose from an intelligent and educated yeomanry, are drawn mainly from a class which has no refinement, no culture, and not much civilization even—that hospital must certainly degenerate. Its degeneracy will be the more certain and the more striking if a short-sighted economy tempts its managers to adopt the readiest, instead of the wisest, methods of treatment, and to choose the cheapest, instead of the best system of administration.

The patients, crowded close together, excite and exasperate each other, and confusion becomes worse confounded. crowd must be brought to some kind of order; and the temptation is very strong to resort to the old and easy way of doing it,—to wit, by main force,—by physical restraint and seclusion. Hence, while in some other hospitals the managers are taking down gratings, removing iron doors, breaking restraint chains, tearing up strait-waistcoats, disusing camisoles and straps, in a word, diminishing to nearly nothing the use of physical restraint and of seclusion, and substituting therefor increased supervision, and a variety of moral means, in that one they are building up new cells, and relying upon mechanical contrivances for restraining the patients. Now, however high among kindred institutions that hospital may have ranked, however excellent it may have been considered at home, it must be ranked low by competent and impartial judges.

Such, in the opinion of the undersigned, by the effect of simple causes, and without manifest fault on the part of any one, is the case with the Hospital at Worcester; and, such being their opinion, they cannot honestly make a report touching the condition of the institution and its concerns without making it known.

The Trustees may as well remark here, that, holding these opinions, they should probably have exercised the power intrusted to them, and made important changes, both in the structural arrangement of the premises, and in the mode of administration, had it not been for several considerations, some of which it may not be inappropriate to mention here.

One consideration is, the conservative character wisely given by the State to the Board of Trustees, in the manner of its appointment. This necessarily makes it slow and cautious about adopting any changes of policy. Now, the policy of delegation of power to other hands, and of non-interference with the immediate management of the Hospital, had been the settled policy of this Board long before any of the undersigned became members of it.

Another consideration is, the hope entertained by all the present members of the Board that the Legislature would take early measures for selling the lands belonging to the Hospital, and erecting new and suitable buildings upon a site more ap-

propriate and advantageous for the establishment, though of far less marketable value. This hope was the result of a belief that such a measure was called for by the best interests of the State.

With these remarks, the Trustees proceed to consider, first, the

NUMBER AND CLASSIFICATION OF PATIENTS.

The number of patients in the Hospital at the beginning of the year was five hundred and twenty.

The number admitted during the year was two hundred and ninety-nine. The whole number discharged was four hundred and twenty-one, of whom two hundred and ten were transferred to the new Hospital at Taunton.

The average number of patients during the year, and during many years, has been enormous. It far exceeds that for which the Hospital has accommodations. It constitutes a crowd. It embarrasses the administration. It lowers the standard of health. It diminishes the comfort and increases the excitement of patients, and the perplexities of attendants. It makes the whole household uneasy. It leads to, and perhaps justifies, the resort to objectionable methods of government, and to restraints which are injurious. It is a prolific source of other evils too numerous to mention. It ought to be diminished, and kept down.

Of the two hundred and ninety-nine patients admitted during the year, one hundred and sixteen were foreigners, of whom ninety-four were Irish, and all paupers.

The Trustees would not mention this fact, in the present state of the times, or they would mention it only to commend the laudable readiness of Massachusetts to care for the strangers within her gates, were it not an important one in view of the classification of patients, which they think it essential for every hospital to have the means of making, but which ours has not. It has been stated to the Legislature before, and it should be repeated, that the Hospital at Worcester is fast becoming a Hospital for foreigners, and that its doors are becoming practically closed against that class of persons who for many years enjoyed its advantages; to wit, the middling class of native population,—the intelligent yeomanry of

Massachusetts, who can afford to pay the cost of their board, and will not ask for charity. The proportion of Irish patients to the whole number was ten per cent. in 1844; but over thirty-one per cent. in 1854.

The State should adopt as her children all who congregate upon her shores. She should make abundant provision for all, of whatever nation, kindred, tongue, or color, who, having found a home within her borders, do there become insane; but that provision, while as favorable as possible to their cure, should be suitable to their condition, their wants, and their capacity for enjoyment. It should be made, too, in such manner as not to cut off any class of her own children, who become insane, from sharing her maternal care and bounty.

It is important and pertinent to the present subject, to bear in mind, that insanity does not change the nature of men and women; that it does not always blunt their sensibilities, or lessen their prejudices, but that, on the contrary, it often intensifies them. Among the insane of this State are wives and daughters, widows and orphans, of farmers, mechanics, ministers, schoolmasters, and the like. These women were taught in our public schools, trained up in our proverbially neat and orderly households, and accustomed to cultivated society; and, however ready and willing they might have been, when sane, to help the poor, and elevate the humble, of whatever race or color, they would have shrunk most sensitively from living next door even to a wretched hovel, and from intimate association with those who are accustomed to, and satisfied with filthy habitations and filthier habits. Now, they do not lose their sensibilities by becoming insane, and they ought not to have them wounded by being herded together in the same apartment with persons whose language, whose habits, and whose manners, offend and shock them. Besides, such associations do not promote the good of any patient, but may retard, and perhaps prevent, the cure of some.

There is yet another class, who have, hitherto, been mingled indiscriminately with the inmates of our hospitals, but for some at least of whom, the undersigned think that express and separate provision should be made, either within or without the common edifice; to wit, criminal lunatics—those who have

committed grave offences, but have been exempted from punishment by the courts on the ground of supposed insanity; and those who, becoming insane while undergoing sentence, are transferred from the prisons to the hospitals.

The presence of any of this class is an evil; and if the number should be much increased, it would be a very grave one. The hospital is a place of refuge for the unfortunate. To make it a place of imprisonment for criminals, is to throw painful associations about it. Nor is the objection merely a moral one. The presence of criminals, who are often desperate men, creates the necessity for greater means of restraint and security than would be required with ordinary patients, and it converts some part at least of the hospital into a prison. The criminal should be treated with care and kindness, but not at the expense of the well being, or the feelings of the innocent insane, or their families.

Now, the presence of these two classes, in such large and increasing numbers, lowers the State hospitals in public estimation; and the consequence is already, that they are less used by those who, though they cannot well afford to pay a high price, will seek the best accommodations for their insane friends. Hence it is, that there begins to be a call for private hospitals and asylums.

The multiplication of these private establishments would be a great evil. It is one that may be prevented by making public hospitals unobjectionable residences for patients of any class; but it will be difficult of cure, if once it obtains footing.

If private hospitals should be multiplied in this State, they will be established with a view of gain. They may become valuable property. It may be impossible to suppress them by legal means, and it will be very difficult to bring them under such legal supervision as will prevent abuses.

The history of civilized nations shows that the multiplication of private hospitals and asylums for the insane will certainly ensue unless public hospitals are of the best kind, and present opportunities for what the people deem proper classification of patients; and it shows, too, that such establishments almost necessarily become serious evils. In Great Britain, so many of them had become places of abomination, that the government had to grapple with the evil, and has lessened and

limited it only by clothing the Lord Chancellor and the Commissioners in Lunacy with inquisitorial and executive powers, which, however necessary for the protection of the lunatic, would hardly be tolerated in this country.

It behooves the legislature to attend to this matter in season, as well to give to the public Hospitals more means of proper classification of patients, as to prevent trouble in future.

HEALTH-MORTALITY-CURES.

The number of deaths, and the number discharged as cured or otherwise, and similar returns, for the past as well as for previous years, will be found stated in the Report of the Superintendent. Such facts are of value in a statistical point of view, when drawn from a long period of time, and from a large number of patients, and with a full understanding of all the circumstances which may have an influence upon them. But as these circumstances can scarcely be alike in different hospitals, comparisons between them must be made with great caution, else they lead to error. As a picture of the Hospital edifice is more or less pleasing according as it is taken from one or another point of view, so an account of its sanatory condition will be more or less favorable according as it may be taken from one or another statistical view. It is natural, in both cases, to choose the most favorable stand point-

The number of deaths during the last year was thirty-four. This, compared with the average number of patients during the year, gives a mortality which, compared with that of the whole population of Massachusetts, is very great, for that is only 1.89 hundreths per cent. Compared with the average mortality in the State Prison, it is prodigious, for that is only three-fourths of one per cent.

It by no means follows from this, however, that the diet and mode of life in the Hospital are less salubrious than in the prison. The prisoners are mostly men of vigorous organization, and at a period of life during which mortality is least. In most of our patients, the original stock of vitality was probably small; in almost all it was sadly impaired before their admission. Many brought here a poor flickering flame of life, which would have soon been extinguished in the gusty world

without, but which is now carefully tended, and will lick up the last drop of the oil of life ere it dies in the socket. It is morally certain, however, that the vital energy of the patients must have been lessened, and the mortality among them increased, by living so much of the time, and in so great numbers, in the badly ventilated and poorly lighted wards and chambers of this Hospital. The state of the air has been a subject of complaint for years. The impression made upon visitors during an hour's visit has been disagreeable and hurtful; what it must have been upon the patients is manifest in their appearance.

The Trustees are happy to be able to state that the arrangements just finished in some of the wards, under the direction of Mr. Jonathan Preston, have proved of great benefit. They remedy the evils so long complained of as much as the structure of the building admits.

There have been no deaths by accident, and but one by suicide, during the year. Considering the number of patients and the fewness of attendants, this speaks well for the watchfulness of the latter.

GENERAL CONDITION AND TREATMENT OF PATIENTS.

In the numerous visits which the Trustees have made, either as a Board, or individually,—visits often made without previous notice, and sometimes by night, they have found evidence enough to satisfy them that the Hospital has been kept habitually as clean and tidy as circumstances would admit; and that the inmates were well fed, comfortably lodged, and kindly treated. They have listened to complaints of patients, but found they were all of such stuff as dreams are made of. In no instance have friends of patients expressed to the Trustees any dissatisfaction.

Now, when it is considered how completely dependent are the patients upon those who have them in charge for comfort, for health, and even for life itself;—how liable they are to injury by one another, by fire, by accidents of various kinds; when it is considered that the attendants may neglect and even maltreat them with possible impunity, and moreover how liable is the possession of great power to great abuses, there certainly is reason for congratulation that in our Hospital, over-

crowded with patients as it has been, no untoward event has disturbed the peaceful current of the year. This is, in a great degree, attributable to the influence of the Superintendent, who, eminently conscientious, vigilant, and industrious himself, has drawn about him a company of assistants who emulate his virtues.

The Trustees think, however, that in several important matters of arrangement and of administration the Hospital needs, and may have, great improvement. One of these is in respect to the

RECREATION AND AMUSEMENTS OF THE PATIENTS.

Among the means of treating the insane, those which help to divert their thoughts from their unnatural channels, and to promote cheerfulness of heart, are very important. most among these are, of course, the associates and attendants of the patients, who should be of pleasant temper and cheerful deportment. But these living agents can be aided greatly by mechanical arrangements of apartments and grounds, by facilities for games and amusements, and the like. In this respect our Hospital is sadly deficient. Most of the wards are ill lighted, and the sunbeams never enliven them. The apartments are of tiresome rectangularity. There are no sunny parlors, no cosy nooks, no cheerful bow windows opening on green lawns; no adornment of the halls, no variety of pleasant sights for the eye, no variety of pleasant sounds for the ear; but, on the contrary, there is a dull monotony in the structure of the rooms, unbroken by diversity of furniture, and an endless extent-square miles, indeed, of walls and ceilings-whitewashed, whitewashed every where, till the eye, wearied with everlasting white, longs even for a stained spot to rest upon. All this, of course, helps to give a character to the establishment, and repels attendants of cheerful tempers, who love to live in sunny spots, and amid pleasant scenes, or it dispirits them after they come. At any rate, the visitor who compares this Hospital with some others, is struck by the grave deportment, the serious countenances, the almost melancholy aspect of attendants and patients. He misses the glad countenance which the merry heart maketh. There is a leaden gravity which seems to defy relaxation; and a gloomy air about the establishment, which must be unfavorable to the cure of insane patients.

This will probably be amended, at least as far as structural arrangements go, by letting in more sunlight, breaking up the monotony of the wards, providing new parlors, and more facilities for amusement and occupations, by other alterations which the Board have directed to be made.

EMPLOYMENT OF THE PATIENTS.

Another very important instrumentality in the treatment of the insane, whether as regards the cure of their malady or the melioration of their condition, is the means of controlling and directing their minds, through the employment of their hands, and the general occupation of their time. These means should be varied, in view of the organization, the previous calling, and the present condition of the patient. The employment should be of such nature, and such degree of urgency, as will agreeably occupy, without severely taxing, the disordered faculties. In view of the plurality of the mental faculties, the occupation should be varied and adapted as much as possible to the disordered faculty, or rather disordered combinations of them, which, however, are almost endless.

A little reflection will show that idleness, so pregnant of evil to the sane, may be equally dangerous to the insane; and that the best remedy for a disordered current of thoughts and feelings is their diversion into other channels by attractive occupation.

In great trouble and in mental anguish, men seek for occupation of body and of mind, lest they should go mad; and, when they have gone mad, they need it in order to get sane again. Even in those cases where excessive occupation, where anxiety, or where over-mental action has caused insanity, it is not total inaction, but change of action, that is required. Indeed, the mind will not rest in recent insanity. It is only when serious changes in the brain lead to fatuity, that it becomes quite quiet; and this condition we wish to prevent, or at least postpone, as much as possible. Hence the necessity of ample provision in every hospital, of varied material and mechanical appliances and contrivances, to aid in the moral treatment of the insane. This matter does not seem to have had

sufficient attention in the organization, or in the administration of this establishment. There is lack of variety and abundance of means of recreation, and also of industrial occupations.

The fact that hundreds of tolerably strong and healthy men and women are most comfortably fed and lodged in one house, at public charge, and yet permitted to pass months and years in idleness and sloth, would shock this active and industrious community, were it not that custom has made it familiar, and seems to warrant it.

It is true that many patients do recover reason under this "let-alone" treatment; but so do men sick with the same malady recover health though treated by doctors of different schools, and swallowing drugs of opposite character. The reputation of doctor and of drug may come from the fact that they so often fail to defeat, and do only retard, the natural processes which bring the majority of diseases to a safe issue. In order to learn which system is best, we must compare one with another working under circumstances as nearly alike as possible.

It is easy to compare our Hospital with others in regard to the variety of occupation provided for the patients, the attention paid to occupying them with industrial pursuits, and the amount of labor they perform. In all these matters many other hospitals take precedence of it. In the British hospitals especially, great attention is given to the occupation of the patients; and some of them almost deserve the name of industrial establishments. Some asylums in Scotland, and some district asylums in Ireland, are particularly distinguished in this respect.

It is true that the circumstances are not the same in the two countries. There is greater development of individuality here; more of self-guidance, and more of voluntary labor. There is less disposition to submit to the direction of others; and, as people do not lose their ordinary characteristics in their insane state, it may be more difficult to keep lunatics busily employed in this country than it is in Great Britain. But one-third of our patients are Irish; the most of whom, if at home, and in some of the district asylums, would surely be kept at work. With regard to the Americans, they are quite as active and industrious as any people; only they are more fond of considering their labor to be voluntary and self-directed; and it

would seem that advantage might be taken of their general peculiarities, so that they would be induced to join in some industrial occupation.

Many, if not most, of our patients are regaled daily at table with what would have been rare, and perhaps unknown luxuries in their former homes. These cannot be needful for their cure; and the enjoyment of them might perhaps be made conditional upon their doing a certain amount of work. Few lose the sensitiveness of the "pocket nerve;" and this, if not already morbidly active, might be quickened by prospect of immediate gain. It certainly would be better for the Hospital and for the State, to have all the inmates who are in ordinary bodily health busily engaged in light work, even by paying for every hour's time, than to have hundreds lounging idly about the wards, gradually losing the tone and vigor of their bodies, and indifferent to every thing except the quantity and quality of the next meal.

Of course the disinclination to steady occupation is seldom to be regarded as laziness, or as in any way culpable, but rather as one of the results of insanity, which deranges the distribution of the nervous energy, and sometimes lessens the amount of it. But though punishment, even by deprivation of comfort, may not be just, yet inducements to regular employment, in shape of wages or of little luxuries, may be both just and proper, by encouraging regular exercise of body and voluntary direction of the mental faculties, which become habitual, and therefore pleasant and salutary.

It cannot be too often repeated that Nature, pitched out even by so rude a fork as insanity, constantly tends to return; and her plain indications may be often relied upon by the uninitiated, though they contravene doctrines announced as axiomatic by the "professors." All agree that it is not right to thwart directly the inclinations of the insane, or to force them to action when disposed to inaction; but still the principle holds, that efforts at self-control are exercises which tend to strengthen the enfeebled mind, and that patients should be encouraged to make them.

It is true that, generally, we have rather to deal with deranged than with diminished mental energy, in cases of recent insanity. There is undue, involuntary, perhaps violent action of certain faculties which disturbs the mental balance, and oversets reason. There is danger that, by mere force of habit, this undue action may become permanent, while by the same cause the inaction of other faculties may be confirmed; and this is to be counteracted, while yet manageable, by strengthening the weakened faculties, and reëstablishing the balance. Constant and urgent inducement to action may therefore be usefully presented to the mental faculties and dispositions which are in abeyance, and new channels opened for the thoughts and affections. In a word, deranged habits of mind should not be left to grow worse by neglect; the patient should not be abandoned to blind chance, but roused to effort, and encouraged to sane mental exercise by succession of pleasant objects, and by agreeable pursuits, which occupy the mind without taxing or worrying it.

For this purpose, places of recreation, games, workshops, gardens and the like, are to be provided in abundance and in variety. But especially should there be opportunity and inducements to engage in those tranquil and salubrious pursuits which a large and well-managed farm presents in greater variety and abundance than can be found elsewhere.

There are facts in abundance to show that these things are most desirable and most useful in the cure and care of the insane.

The value of the work done by the patients in the Worcester Hospital in 1853, when there was over 500 of them, was only \$2,000, as estimated by the Superintendent. Only about one in five there does a moderate day's work. In summer time about one-quarter of the patients are said to do a moderate day's work; in winter only about one-fifth. The Superintendent estimates that only \$300 a year is saved to the Hospital by the aid which the men render, and only \$700 by that of the women.

The Reports of some of the British Hospitals furnish a striking contrast to this. In them, three-quarters of the patients are industriously and usefully occupied. Some of the details of their industrial pursuits show a striking contrast with ours, and are, moreover, interesting in a moral point of view.

The Report of the Wilts County Asylum for 1852 says:—
"The employment of the patients is an object of primary

consideration. A large proportion of the men are engaged in agricultural pursuits."

"Under the active and judicious superintendence of the matron, an increasing majority of the female patients are occupied in the domestic labors of the kitchen, laundry and wards, and in needlework. The greater part of the bed and house linen has been, and is in process of being, made by the assistance of a single seamstress."

The Report for 1852 says: "The original outfit of clothing was supplied by the Asylum for the North and East Ridings of Yorkshire, an institution in which the industrial system has been developed to the fullest extent, and where it was made entirely by the patients. This is probably the first instance of an asylum entering into a contract of such a kind. Great interest was excited among the patients, who were made aware that they were preparing clothing for another asylum; and quite a sensation was manifested when two carts, laden with heavy bales of woollen clothes and shoes, shirts, and dresses for the women, left the rooms of North and East Ridings Asylum."

Again: "during the year, all the clothing required for the increasing number of inmates has been made by the patients. In the tailors' and shoemakers' shops much work has been done, the amount of which will be seen in the tables appended to this Report. The female patients continue to be extensively engaged, under the direction of the matron, in the various services of the kitchen, the laundry, and the wards, and a large stock of clothing and bed linen has been made by them, assisted only by their ordinary attendants; it not having been thought necessary to fill the place of the seamstress, who left her situation at midsummer. A further reduction in the staff of servants of the establishment has been effected by the discontinuance of a second laundry-maid; and, after some months' trial, the success of this plan may be considered as proved." Now, the Wilts County Asylum is not particularly distinguished for industrial activity among English Hospitals. the contract were made with some others, the inactivity which characterizes ours would be more striking. There employment is the rule, idleness the exception; here it is the contrary. There activity well directed, begets salutary industry; here idleness undisturbed, becomes enervating sloth. It does not appear that the occupation of the patient retards cure; but, on the contrary, the evidence of its good effects, in a salutary and curative point of view, is most abundant and convincing.

The Trustees think that the Worcester Hospital may be greatly improved by more ample provision of means of industrial occupation in workshops and upon the farm, and that the present relief from the crowd (whose pressure has acted so unfavorably to all improvement) furnishes a good opportunity for introducing a better system of internal administration with this view. The Trustees would not have the Hospital converted into a workhouse. They would not enforce labor, or require it with any view to immediate pecuniary gain; but they believe that the majority of the patients may be induced to do a considerable amount of useful work, and, at the same time, promote their own health and happiness.

HABITS OF THE PATIENTS.

Following after this evil of inactivity, and probably aggravated by it, is the great prevalence of morbid appetites and filthy habits among the patients. This, too, is a matter respecting which it is difficult to make comparisons with other hospitals; but from all that can be learned by the Trustees, the proportion of what may be called morbidly filthy cases is uncommonly great in the Hospital at Worcester. Before the exodus to Taunton, nearly half the whole number were of this description, and the proportion is fearfully great even now. This is a delicate matter to touch upon in a public report; nevertheless, it is an important one. It regards the comfort and well being of the patients; it is an indication of the hygienic condition of the household, and of the degree of medical care bestowed upon it; and to avoid mention of it on proper occasion would be squeamishness.

By filthy patients is meant those who, if not watched and prevented, will be mear their persons with, and even swallow, substances the most disgusting to the natural taste.

Now, all morbid appetites and unnatural habits are consequent upon, or certainly connected with, some derangement of the bodily functions; and though the derangement may be of special or minute parts of the nervous system, or even of

intangible, and as yet obscure magnetic agencies, still, beyond a peradventure, it must be increased or diminished by the varying conditions of the great organs whose functions seem to be more under our cognizance and control. A lunatic may tell a hawk from a handsaw after supping on dry toast, but be perplexed by their resemblance after minced pie. A suicidal patient may be content to live through the night if he has eaten the one, but be looking after razors and ropes if he has swallowed the other. In the same manner, the distortion of tastes, which makes things seem comely and desirable that are usually offensive and repulsive; the inversion of natural tendencies which makes filth pleasanter than cleanliness; and the perversion of appetite that renders substances palatable which are usually disgusting—these must be more or less salient, according to the condition of the bodily health of the In all these matters there is great room for improvement; and the relief given by the reduction of the number of patients, by improved ventilation, and by the greater amount of medical and moral care which can be given by the Superintendent to each case, will probably bring it about. naturally leads to notice of the

DUTIES AND CARES OF THE SUPERINTENDENT.

It seems to the Trustees that too much labor and responsibility, aside from his medical duties, have devolved upon the Superintendent of this Hospital. Eight hours a day of such close study as a careful physician ought to bestow upon the malady of his patients, is surely as much as a man of ordinary powers can bear, and wear well. But eight hours divided among the patients of this Hospital, when it is crowded, would give but about three-quarters of a minute to each, supposing not a second to be lost in passing from one to the other; and it would give only about a minute and a quarter to the present number. But, in reality, with all possible diligence, not one minute could be given to each case.

It is commonly thought, that since most of the patients in a public hospital are chronically insane, and since their condition does not vary from day to day, all that the physician has to do is, to assure himself of their presence and safety by a glance at

them as he walks through the wards. But every day effects changes, more or less considerable, in every organized body and there are exceptional cases in which, by some extraordinary revolution in the system, reason is restored in the most unexpected manner. These changes may come at any time; and they should be watched for, in order that the curative tendency may be favored. It should be assumed that they may happen to each and every patient, however old and desperate his malady. As the anxious parent clings to hope so long as there is a spark of life in a child's body, so the physician of a hospital for the insane should hold that there is a hope, because a possibility, of each patient's restoration to reason. He should bear in mind that each one is somebody's beloved child, or parent, or relation; or, if not, then that he is doubly unfortunate, and should, therefore, be doubly interesting to him.

Besides, there are many patients who will not speak of any pain or suffering which they may be undergoing; and some who cunningly conceal it. Certainly, therefore, the physician should make frequent personal observation of each, and especially of those cases where the patients are too much demented to seek relief of their own accord, even when suffering ever so much. But if we allow that five minutes should be given to each case, the physician would have to labor ten hours daily in order to attend to each patient three times a week. It is true, he has his assistants; but his ablest and most trusty assistants are his own senses, and upon them he must mainly rely.

Such calculations of the division of time cannot, indeed, be very accurate or valuable; for some physicians have a natural quickness of perception, so sharpened through practice, that a patient's condition is seen at a glance, as by a flash of revelation. They have the intuition of genius. But surely, after making every allowance, it must be admitted that the proper medical care of the individual patients,—the regulation of their diet and regimen,—the contrivance of their amusements and occupations, and the general oversight of the moral condition of the great household—these things are enough to occupy fully and worthily the time and the energies of one man.

But, besides these duties, many others are imposed upon the

Superintendent by the statutes, or have devolved upon him by the common law of custom. He has to carry on the extensive correspondence of the Hospital; and much of this he cannot do by deputy. He virtually appoints, and is responsible for, the Assistant Physicians, Steward and Matron. He directly appoints, and is responsible for, the Clerk, Apothecary, Supervisors of Departments, Overseers of the Wings, Overseers of the Laundry, Bakery and Workhouse, Watchman, Farmer, and all necessary Attendants in the galleries, laundry, bakery, kitchen, workshops, and on the farm. He must "see, constantly, that all persons thus appointed by him, and also all subordinate officers appointed by the Board, perform, faithfully, the duties required of them; and from time to time he shall give them such instructions as the may deem necessary to secure the exact and thorough performance of their respective duties."

But, besides all this, the physician is, virtually, head of the Steward's Department, and does a great deal of duty in other departments which require much thought, and of course, divert much of his power from his more legitimate field of action.

Now, much of this labor and responsibility ought to be, and may be, spared to the Superintendent, and still a great deal will remain. The "one-man power" must be maintained in such an establishment. The Superintendent must be the real head of the household, and have patriarchal power; hence the obvious necessity of so restricting the number of patients that he can have daily and intimate knowledge of their individual condition, and time and strength left to make all the necessary provisions for their safety, comfort and cure. To gather into this Hospital, therefore, more than twice as many patients as can be thus carefully, properly and faithfully treated, is justifiable on no ground but that of stern necessity, which the State cannot plead. To gather into it any more is unwise. It is not even justifiable on the ground of economy; for in this matter of care and cure of the insane, as in other matters, the best way is the cheapest. It is the way that the men of Massachusetts manage their individual business. In their banks, manufactories, and workshops, they do not burden their cashiers, agents and overseers, with such a load of business that some part of it must be slighted, some neglected, and all of it done hurriedly; and they should not so burden the Superintendents of their Hospitals. To attend to two hundred patients faithfully and efficiently is good work for a good man; to attend to two hundred and fifty will tax the energies of the best one to the uttermost. More than this one man cannot do, and do well; and let not Massachusetts require him to make the vain attempt.

MECHANICAL RESTRAINT AND SECLUSION OF PATIENTS.

The sight of scores of men and women confined in cells, dignified by the name of strong rooms, or restrained in the use of their limbs by mechanical contrivances, has long constituted the most melancholy feature of this Hospital. In the mind of the visitor who doubted the necessity of this rude method of treatment, and who suspected that its adoption was the result of a parsimonious selection of the cheapest rather than the best method, the melancholy was not unmingled with sterner feeling.

There is about the insane a helpless dependence that is more touching even than that of woman; so that the unnecessary abridgment of their personal freedom, or the needless diminution of their remaining means of enjoyment, is a wrong which, if done with intent, or through unworthy motives should meet with indignant reprobation. It has been done in this Hospital partly through a supposed necessity, and partly in consequence of the crowd of patients forced into it. It is still done in other public institutions where the insane are confined, and the matter therefore, should, in every possible way, be brought before the public; and appeals should be made to the intellect and the conscience of the people, until the wrong ceases.

The assertion, that public opinion in New England is less enlightened than that of Old England with regard to the treatment of the insane, may seem strange, but nevertheless it is true. It is true, moreover, that here, in Massachusetts, practices are tolerated in some institutions* where the insane are kept, which would there be indictable at common law, as will be shown presently.

There are in the Worcester Hospital forty-eight "strong

^{*} There are 23 insane persons confined in prisons in Massachusetts, and 152 under charge of jailers.

rooms," or rather cells. They are built of stone or brick, precisely like prison cells, with grated doors and windows, apertures for putting in food, taking out vessels, &c. They are so contrived that they can be easily warmed and cleansed from filth that offends the eye, but in all other respects they are unfit abodes for human beings. The older ones are perfectly detestable. Opened to the more enlightened moral sense of this day, they seem like the relics of a comparatively barbarous age. Well might the Trustees, in the Report of last year, ask, "How is it possible that the furious, the violent, the indecent should ever be restored while occupying apartments unfit for the abodes of dumb beasts?" They might have added, that any sane man, unless an eminent non-resistant, would become "furious and violent" by being placed therein.

Even those cells constructed at so great cost within a few years, are not fit habitations for the worst maniac, because they needlessly aggravate his malady and his misery. They, too, are stone cells, with iron doors and grated windows.

These cells have been almost continually in use since they were built; and when the Hospital was as crowded, as it sometimes has been, their use has doubtless seemed absolutely necessary.

So many unfortunate men and women have been shut up in them year after year, and so many others have been restrained by mechanical contrivances, that such imprisonment and restraint have come to be considered as matters of course in the treatment of the insane by official and unofficial visitors, by legislative committees, and, to a certain extent, by the public at large.

Now, it can be shown that neither "seclusion" nor "restraint" of insane persons is necessary, saving in rare and exceptional cases, and then only for short periods of time and in ordinary rooms; first, by general reasoning; second, by experience in other places; third, by experience here at home within the last year.

First, as to the general reasoning. "Seclusion" of an insane person is a dainty word for expressing his imprisonment in a cell. Restraint is a dainty substitute for fettering his hands or feet, or both, the fetters being of leather instead of iron.

Insanity, as was remarked before, deranges, but does not

alter, the nature of men. It often merely intensifies certain modes of mental action. It is especially apt to intensify the lower and peculiarly selfish propensities. In dealing with insane emotions and passions, we have often to deal with sane ones merely raised to a higher power.

Human nature continues to pervade the motives, though the actions be ever so extravagant; as gravity pervades particles of matter that may be forced upwards or sideways by disturbing forces. We are to consider that opposition provokes to anger, and that the soft answer turns away the wrath of insane as well as of sane men. We are to consider the principle, that whatever directly represses the individuality; whatever restrains the personal liberty; especially whatever restrains the freedom of motion and locomotion, instantly excite opposition, temper and rebellion. This is a sort of oppression of individual right and freedom, which the most dull or deranged intellect can feel, and which every one instinctively resists.

It is amazing how contentedly and unconsciously men bear oppression, if their arms, legs and tongues are free. A man who was sitting contentedly in a room immediately desires to go out if any one locks the door. A man who never cared to leave his quarter of the town, if put under arrest, at once wants to break the jail limits, though they are as extensive as the whole county. If the Legislature should enact that no inhabitant of Massachusetts should leave the State under heavy penalties, there would be a rush of men, women and children towards the borders.

The more directly restraint affects the person, the more feeling and opposition it excites. A man who would only be indignant if confined in a room, is furious if his hands are tied. A woman who would only scold and fret at the imprisonment, would scratch and bite at the bonds. An angry man whose doubled fist would be dashed into any face that wore a look of defiance, is soon calmed by a placid smile.

Now, the natural supposition is that people are not utterly changed in these respects by insanity. So long as the senses are unimpaired, and the perceptive faculties, or any of them, are active; so long as any reason remains, (and its light is seldom entirely quenched,) so long must men be more or less subject to the ordinary laws of humanity.

Secondly. Abundant recent experience confirms the inference that would be drawn from a priori reasoning, and proves that forcible restraint of insane persons usually does more harm than good, and is very seldom necessary. Indeed, the great modern reformation in the treatment of the insane is founded upon this idea. The heroic Pinel confided in it. Having with difficulty got permission from the timid authorities, who prophesied all sorts of evil, he first made what was deemed the perilous experiment. He went to the cells of the great Parisian madhouse, where furious men were struggling with their chains, striking at whoever approached the gratings, spitting at them, and yelling themselves hoarse with curses and imprecations. He boldly entered, and having charmed and calmed the maniacs by his gentle but firm bearing, he struck off their fetters. The prisoners were amazed at the sudden recovery of freedom, and at the unexpected fact that no one would fight or oppose them, and they soon became appeased and quiet. They did not abuse, nor even care to exercise their freedom, but soon yielded to that common instinct of humanity which is seldom lost, even through insanity,—the instinct which leads us in childhood, in sickness, in prostration, whenever, in short, we are conscious of inability to guide ourselves, then to seek the guidance of others, and, if the guidance cannot be found in men, to seek it of God.

A reform was commenced at once; and though it has been obstructed, and occasionally retarded, as all reforms are sure to be by timid conservatism, it has been carried on with the most blessed results. In all civilized countries the reformation was hailed with pleasure, and in all its principles were admitted to a certain extent; though practiced upon far more heartily and fully in some than in others.

In some British hospitals the reform became a complete revolution, and all forcible mechanical restraint of patients and all seclusion were completely discarded. Their example has been virtually followed by some hospitals in this country. In others the principle of the reform was not admitted with full faith, and there the old usages were clung to, or given up grudgingly and by halves. The old cages were improved a little, and called "strong rooms;" and the iron chains were replaced by leathern straps.

There was a conflict of opinion and of words. The force of reasoning and the weight of evidence soon seemed in favor of an almost complete reliance upon moral means, and an almost complete abandonment of forcible restraint and seclusion, in the treatment of the insane. Still, however, this "almost" left a wide margin for variety of practice in different hospitals, and for honest differences of opinion as to the degree in which the principle of non-restraint, as it was called, could be safely acted upon. In this, as in all similar matters, men's judgments were unconsciously affected by their character. Bold and hopeful reformers went forward; cautious and doubting conservatives held back.

The British Commissioners in Lunacy, conscious of the vital importance of this matter, issued circulars to the Superintendents of public and private hospitals in the kingdom, asking for the result of their experience in regard to it. The answers are from one hundred and eighty-one institutions, and embody a vast amount of interesting and important information. In June, 1854, the Commissioners made their Report, which concludes thus:—

"As the general result which may be fairly deduced from a careful examination and review of the whole body of information thus collected, we feel ourselves fully warranted in stating, that the disuse of instrumental restraint, as unnecessary and injurious to the patients, is practically the rule in nearly all the public institutions in the kingdom, and generally also in the best conducted private asylums, even those where the 'non-restraint system,' as an abstract principle, admitting of no deviation or exception, has not, in terms, been adopted.

"For ourselves we have long been convinced, and have steadily acted on the conviction, that the possibility of dispensing with mechanical coersion, in the management of the insane, is, in a vast majority of cases, a mere question of expense, and that its continued or systematic use, in the asylums and licensed houses where it still prevails, must, in a great measure, be ascribed to their want of suitable space and accommodations, their defective structural arrangements, or their not possessing an adequate staff of properly qualified attendants, and frequently to all these causes combined.

"As respects the question of seclusion, it will be seen, upon a perusal of the statements in Appendix (G,) that its occasional use for short periods, chiefly during paroxysms of epilepsy or violent mania, is generally considered beneficial.

"At the same time, we would observe, that the facilities which seclusion holds out to harsh or indolent attendants, for getting rid of and neglecting troublesome patients under violent attacks of mania, instead of taking pains to soothe their irritated feelings, and work off their excitement by exercise and change of scene, render it liable to considerable abuse; and that, as a practice, it is open, though in a minor degree, to nearly the same objections which apply to the more stringent

forms of mechanical restraint. We are, therefore, strongly of opinion, that, whenever seclusion is resorted to as a means of tranquillizing the patient, it should only be employed with the knowledge and direct sanction of the medical officers, and even then be of very limited duration.

"Further experience, we think, has shown that, except for the reception of epileptic patients during the continuance of their paroxyms, and, in a few cases, where there is a determined propensity to suicide, the utility of padded rooms is not so great as was at one time supposed, and that, for eases of ordinary maniacal excitement, seclusion in a common day-room or sleeping-room of moderate size, from which all articles that might furnish instruments of violence or destruction have been removed, and which is capable of being readily darkened, when required, by a locked shutter, will, in general, be found to answer every useful purpose."

In many American hospitals the principle of "non-restraint" has been acted upon wisely, though without that attachment to a theory which leads some to forbid a resort to any mechanical restraint or foreible seclusion, even in those rare but not unknown cases which are manifestly benefited by their prudent use.

The Trustees have long regretted that circumstances did not permit the adoption of this reform as fully at Worcester as in other American hospitals.

A Committee of the Board last year visited nine hospitals out of New England, and there found that, taking the whole number of patients, only one in three hundred was confined in a strong room, while at Worcester more than ten times that proportion of patients were so confined. There were less than six hundred patients; and yet the forty-eight strong rooms were almost continually used for the forcible seclusion of men and women, many of whom were raving, and whose wretchedness was doubtless increased by their imprisonment and restraint.

The records of the Trustees will show how often and how strongly they have denounced these rooms as unfit places of habitation. But there was always a crowd of patients within the Hospital, and more pressing for admission. Those in charge deemed it necessary to use these rooms. Still, therefore, men and women were thrust into them, and made more furious by the confinement; and still many others were restrained by straps and various mechanical contrivances, who might have had freedom of motion, and the use of their limbs, if sufficient space and sufficient means of medical and moral treatment had been at command, and if there had been fuller faith in

the efficacy of milder measures. The principal evil, and that which seemed to justify the use of so much seclusion and restraint, was the crowd of patients. Of this evil, the Trustees and the Superintendent have complained, as often and as loudly as seemed becoming and proper to do.

In 1853, the crowd was so great, and the danger of an epidemic so imminent, that a vigorous effort was made by the Trustees to lessen the number, by summarily discharging one hundred patients, and throwing them back upon the town authorities. This, however, caused so much opposition, so much complaint, and so much real distress, that it was not persevered in long.

Thirdly. An opportunity has been furnished during the last year of showing here at home, by actual experiment, and beyond all possibility of doubt or cavil, that the imprisonment and restraint of insane persons, as practised at Worcester for so many years, was not necessary for their proper care and safe-keeping. During the months of January, February and March, there had been sixty-six patients confined in the "strong rooms," twenty-one of them during the whole time, thirty-three nearly half the time, the others during various periods from a day to a month.

In April, two hundred and ten patients were removed to the new hospital at Taunton. The patients selected were those whose homes were in the neighborhood of Taunton, and not those who were most troublesome. By reason of one of those curious circumstances which, if unnoticed, defeat statistical calculations, it so happened that only a few of them were of that violent class whom it had been deemed necessary to confine at Worcester. Still, however, the change in their condition, and consequently in their conduct, after arriving at Taunton, and enjoying the superior advantages of the new hospital, was most striking and most gratifying. dred and two out of the two hundred and ten patients enjoyed the full liberty of the hospital, and the free use of their limbs, from the moment of their arrival. Not a single one was confined in a "strong room." Nine were occasionally restrained, by being shut up in their ordinary chambers, or wore the camisole, or leathern straps, a few days at a time. One unfortunate woman only had to have her hands confined most of the time,

though even she is now free. Among the patients transferred were three who had been confined in strong rooms during the whole of the three last months passed in Worcester, and six who had been confined a third of the time. Now, every one of these men were left perfectly free, and have remained so, and have done no harm to themselves or others.

These facts, added to that of the confinement in prisons of so many lunatics innocent of crime, prove the truth of what was said above, that Massachusetts has been and is treating lunatics in a manner that would be indictable at common law in England.

In 1853, a man named William Robert was tried at the Carnarvonshire Summer Assizes for having kept his brother, a lunatic, needlessly confined with a chain in a room about the dimensions of our strong rooms at Worcester. There was no cruel *intent* proved or even alleged; there was no stint of food; the man was in good health, and fat; he was kept as well, perhaps, as his relatives knew how to keep him; and yet Robert was found guilty of "unlawfully confining and imprisoning his brother in an improper, excessive and cruel manner," and he was himself condemned to one month's imprisonment.

Lord Chief Justice Campbell, in his charge to the jury, distinctly stated the principle, that the use of restraint greater in degree, more severe in character, or longer in duration, than is necessary for the security and care of a lunatic, is an offence at common law, and indictable as such.

Massachusetts is a sovereign State, and will not answer the summons of any earthly court. She cannot be mulcted in damages; and there is no prison large or strong enough to hold her. But there is a higher court before which she is arraigned continually; whose sentence she cannot escape; but which she must execute upon herself. The plea, that she had no cruel intent, will avail but little, and that of ignorance can no longer be made. If, in her hospitals, jails, houses of correction, and almshouses, the helpless insane continue to be subjected to greater privation of freedom and to greater suffering, than are absolutely necessary for their care and safekeeping, she will be continuing in wrong doing, and must suffer the heavy pen-

alty of a condemning conscience, or the heavier penalty of lack of conscience to condemn.

The Trustees, anxious to prevent any relapse into the old system, under any pressure of a crowd, or under any supposed necessity, and aware, moreover, of the temptation which the existence of "strong rooms" offers to attendants to get rid of the trouble of watching patients, by confining them under bar and bolt, have directed the demolition of most of these offensive cells, and the construction of comfortable sitting rooms in their place. They trust that their successors will persevere in the work, and that, in future, no seclusion and no mechanical restraint will be used here, for the treatment of the insane, except in those rare cases where solitude is required, or where the patient must be restrained, either by men's hands or by instruments, and in which the latter is the least objectionable.

REMEDY FOR DEFECTS. IMPROVEMENTS, ETC.

The Trustees having thus commented upon several imperfections of the Hospital, without, however, exhausting the subject, may, of course, be expected to propose some effectual remedy therefor. This they did in a memorial to the legislature at its last session. To this memorial they now refer, with the remark, that additional experience, observation and reflection, have confirmed them in the opinions there set forth.

They showed that there are many important defects in the establishment, which are radical and irremediable, and which must embarrass those who administer its affairs, and prevent them from doing so much for the cure and care of the insane as they might otherwise do.

First. That the site of the building has become a very unfavorable one, owing mainly to the rapid growth of the neighborhood. The once quiet village of Worcester has become a busy manufacturing city, and is rapidly encompassing the Hospital. Roads, streets, and rail-tracks run in front and rear, and across the premises, so that the patients cannot go to walk, or ramble in the fields and woods, without crossing some of them. They cannot even stroll quietly in their own grounds and gardens with any privacy and quiet. They are subject to the observation of the curious, and the rudeness of the indiscreet.

Now, the noise and din, the hurry and bustle, of an enter-

prising manufacturing town, the busy streets, the swift succession of passers by, the rush of cars, and the shriek of steam whistles, may be pleasant and useful to certain patients; they may furnish a desirable excitement; but the Hospital should be so placed that such patients can have access to them, without being so placed that none can escape from them.

Second. The memorial showed that the sewerage is very imperfect, and that, owing to the situation of the land, no feasible method had been found for carrying off the waste water from the building. This is received into the gardens; and there some of it is absorbed, and some is evaporated, while some remains stagnant at certain seasons, so that the air must be more or less vitiated.

Third. That the structure of the main building is, for this age, very bad. It has five kitchens, instead of one central one. It is inconvenient in many respects. It lacks the many conveniences and appliances which experience has shown to be important in the administration of such establishments, and conducive to the comfort and well being of the patients. Owing to the want of height between the floors, and to other radical defects, it cannot be so modified as to meet the advanced requirements of the times.

Fourth. That the arrangements for ventilation were never sufficient, and that, owing to structural defects in the building, they can never be made so. There is not sufficient volume of air in the wards; and it cannot be kept pure without changing it so rapidly as to create almost a gale of wind. The evil has been much lessened by arrangements adopted this season, but it cannot be completely abated.

Fifth. That the arrangements for warming the building are imperfect and insecure. The building has already been on fire several times! The risk of fire is still greater than prudent persons ought, unnecessarily, to run. It is greater than careful men of business would run in a manufactory filled with valuable merchandise.

These reasons were deemed sufficient to warrant a recommendation to the legislature that the grounds and buildings should be sold, and a new building erected upon a suitable site in the immediate neighborhood. This recommendation the Trustees distinctly made, and they endeavored to enforce it by other considerations, such as that—

First. If the old building is to be continued in use, the State is bound, by considerations of safety of the patients, to introduce a secure and efficient apparatus for warming. The best one yet tried, and which would be applicable to the building, is a steam apparatus, and this would cost from sixty to seventy-five thousand dollars.

Second. The real estate of the present Hospital would sell for at least one hundred thousand dollars more than the cost of a suitable site for a building and a good farm in the neighborhood. There would be a saving of one hundred and seventy-five thousand dollars, so that there could be no weighty objection on the lower considerations of economy, to what is called for by higher considerations of humanity; to wit, the erection of a new hospital in all respects worthy of the State.

The Trustees might further enforce this recommendation by many considerations, the result of the last year's experience and observation, but they will close by quoting, from a high authority, a passage very much to the point.

The Commissioners in Lunacy, in their last Report to the British Parliament, July, 1854, after speaking of their endeavors to improve the condition of hospitals, conclude thus:—

"We regret to say that our endeavors in this respect are, in several of these institutions, opposed by great difficulties, some arising from defects in the original construction of the buildings, and others from an adherence to certain errors in management and treatment, which, in the best conducted establishments for the insane, are condemned, and have now become obsolete.

"Indeed, so formidable are the difficulties in the way of advancement, in old and badly situated hospitals, that, in those instances where improvements have been attempted, large sums of money have sometimes been spent without adequate results. In such cases, the only effectual mode of overcoming all obstacles to improvement appears to be, to abandon the old buildings, and erect new buildings on eligible sites; a course which has already been taken at Manchester and Stafford, and about to be adopted at Nottingham."

In consequence of the memorial of the Trustees, the legislature, at its last session, appointed a Commission to consider the matter, and also to ascertain the number, condition and wants of the insane in the Commonwealth, and to report upon the subject generally.

This Commission has performed its arduous task with remarkable skill and success. There has, probably, never been collected, in any large community, such a mass of minute,

thorough, and reliable information, concerning the number and condition of the insane, as has been gathered by this Commission, excepting, perhaps, that gathered by the eminent Queterlet in Belgium.

They have ascertained the names, age, sex and condition of over twenty-four hundred insane persons, and of more than one thousand idiotic persons.

This information will soon be spread before the legislature, and will show the pressing necessity of further and immediate provision for the insane of the Commonwealth.

The Trustees have had several interviews with the Commissioners, and, after earnest consideration of the subject, have coincided with them in the following conclusions:—

That there is urgent need of more accommodations for the insane, and that, therefore, a new Hospital should be erected immediately in the western part of the State.

That the new Hospital should be constructed for no more than two hundred and fifty patients.

That final action upon the question of the disposition to be made of the property at Worcester, and the erection of a new building in that neighborhood, (though the questions deserve serious attention,) should be deferred until after the Western Hospital is completed.

That further alterations and improvements shall be made in the old building, by means of funds now in the hands of the Trustees, and the inconveniences and evils be borne as they best can be, in view of their effectual remedy within a few years.

It is partly in consequence of having come to these conclusions that the Trustees have directed several alterations and improvements in the old building and grounds.

Respectfully submitted by

S. G. HOWE,
REJOICE NEWTON,
JAMES B. CONGDON,
LINUS CHILD,
HENRY MORRIS,

Trustees.

Worcester, December, 1854.

TREASURER'S REPORT.

To the Trustees of the State Lunatic Hospital:-	
The Treasurer respectfully reports:—	
That the balance of cash in his hands on the	•
30th November, 1853, was	\$23,131 85
Since which time to the 30th of November,	4
1854, he has received	
From the Commonwealth, for the support of	
Lunatic Paupers, the sum of	19,108 84
From cities, towns, and individuals,	32,736 52
From the Steward of the Hospital, for articles	
sold,	344 27
For interest on Worcester and Nashua Railroad	
Bond, a legacy of Ziba Storrs,	30 00
	#PF 0F4 40
	\$75,351 48
The Expenditures of the year have been as followed	ows:
For Wages and Labor,	\$11,543 98
Improvements and Repairs,	3,645 44
Furniture,	1,333 82
Clothing,	1,626 90
Flour, 457 barrels,	4 000 10

JAMES B. CONGDON, Auditing Committee.
January 15, 1855.

SUPERINTENDENT'S REPORT.

Twenty-second Annual Report of the Superintendent to the Trustees of the State Lunatic Hospital.

GENTLEMEN: - The interesting facts and events that have occurred in this institution the past year are herewith presented. The health of the inmates generally has, perhaps, never been better. There has been but very little acute disease, and nothing like an epidemic, among our household. By the timely transfer, to the kindred institution in this State, of two hundred and ten patients, the remainder were saved from the contaminating influence of an excessively crowded house during the warm weather. By order of the governor, we conveyed to the Second Hospital for the Insane in Taunton, on Friday, the 7th of April, and on each of the five succeeding Fridays, a car load of patients. By an arrangement of the railroads, an extra engine took a car filled with some thirty-five patients, and from two to five attendants, and ran to meet the connecting train. There was no accident, and, indeed, no difficulty, in the transfer. The patients were mostly of a very orderly class, and they were gratified with the ride. The patients selected by the Governor were those from that section of the State, and from the counties of Norfolk, Suffolk, and Middlesex-being one hundred and five of each sex. During this time, our number of patients was reduced from five hundred and fifty-nine to three hundred and forty-three. reduction took off no more than the overplus, and left this Hospital quite full, but not crowded. The relief thus afforded us was seized upon to paint and fit up several of our wards. But more desirable to us than for any thing else, it gave us a possible chance to abandon nine strong rooms that had been daily used, ever since the institution was opened, for the violent and filthy males, and also to disuse, forever I trust for that purpose, eight rooms in the basement of the north old wing,

for the same class of females. These seventeen rooms have not been occupied at all, for seven months past, by patients, but they have been converted to other uses. They were never proper for the purposes they were designed and put to; and, of late years, they were used only from what we thought absolute necessity.

Abandoning these ill-contrived rooms, and reducing the number of our patients to about the capacity of the institution, has lessened our cares and responsibilities, while we have been enabled thereby to improve very materially the general appearance of the institution and condition of its inmates.

The improvement in the ventilation, which, under the direction of the Hon. Jonathan Preston, has, in part, been effected, and which will soon be finished, will render our wards still more healthful and pleasant. We know that one fruitful source of the just odium this Hospital has received the last year or two arose, in a great degree, from its crowded wards, another from its defective ventilation. The atmosphere of apartments occupied by the healthy, we all know, becomes vitiated soon, unless frequently changed. The air of the wards of hospitals becomes vitiated, not only by respiration, but by diseased secretions of the sick. At this Hospital, the same room that is used as the sitting-room by day is made the dormitory at night. The means of ventilating the sleeping apartments in this Hospital are undoubtedly much more ample than they are in the greater part of the private dwellings in this State. But still, for a hospital, the means here are de-Besides the window in each room, these means of ventilation consist of an opening over the door, about eight inches by thirty, into the gallery, into which the warm air of the furnaces is diffused. Leading from each room, ventiducts, opening in the attics, are constructed in the partition walls. These ducts are about four inches square. In most of the rooms there are two of these ducts-one from near the bottom, and one from near the top. In those rooms that have but one duct, that one is about four inches and a half square. improvement consists in continuing these ventiducts as they come up to the attic, each story by itself, in wooden boxes, into a main shaft near the chimney, into an enlargement of which, recently altered for that purpose, this main shaft enters,

and there the foul air from the rooms below comes in contact with the nine-inch cast-iron smoke-pipe of the furnace in the basement. Where it was not convenient to collect these ducts into a brick chimney, Collins's Ventilators, thirty inches in diameter, have been placed on the roof for that purpose. Heretofore, the foul air that came up through these ducts into the attic diffused itself through the whole attic, seeking an open window to escape, or to find another duct in which the current was reversed by some means. It has been not at all uncommon to find the current up in one duct, and down another, in the same wing of the Hospital at the same time. When the wind is strong against one side of the Hospital, and windows open on the opposite side, it is not unfrequent that the air rushed up the windward ducts, and down the leeward ones. In ducts in the outer walls of brick buildings, the current of air in winter is often down, and in summer up; because, in winter, the walls and ducts are colder than the air inside, and in the summer the duct is often warmed by the direct rays of the sun on the outside, and the air in the duct is rarefied and The internal partitions, when of brick, become colder in summer than the surrounding atmosphere, and condense it, and the current in flues in them is often down. smell of soot, from chimneys unused in summer, is from the same cause. It is supposed that this change in the mode of ventilation will increase the quantity of foul air that will pass off, by increasing the currents, and render less liable the foul air to return to the wards again after it has been carried to the attics, by conveying it more directly to the Collins's Ventilators or to the tops of the chimneys. The foul air, after it gets into the chimneys, comes in immediate contact with the cast-iron smoke-pipe, which, by its heat of the furnace for six months or more in the year, will keep up a constant current upwards in the ducts below. The external winds, the harder they strike upon the Collins's Ventilators, will so much the more increase the currents in those ducts that are collected in them. fixtures described above refer to the ducts that start from the bottom of each room. The flues that start from the top of the rooms open into the attic yet, and in extreme cold weather will be closed, to enable us to warm the wards sufficiently. All the water closets recently renewed are ventilated downwards, which is also a decided improvement upon the old movable pan. One new sewer has been laid down, and another has been covered over a hundred feet farther from the building. Other of the drains need covering, which can be done early in the ensuing spring; when, also, the piggery should be removed, from the place it has occupied for twenty-two years, to one more remote from the buildings. When the wind is easterly, these pens have been offensive from their proximity.

More than one-third of this year had passed before any of the commitments were diverted from this hospital to the new hospital in Taunton; hence our books show some admissions from the counties in that section of the Commonwealth. It is probable that hereafter there will be but few, if any, sent here from that part of the State, although there is nothing in the laws, I believe, by which judges are required to commit the insane to that hospital rather than this. That point was undoubtedly left unsettled purposely, that the friends of the patient might make their election between the two institutions. The laws give the governor authority, from time to time, to equalize, if need be, the relative numbers in the two hospitals, by transferring such patients from one to the other as he shall see fit.

The results of the year have been favorable in a curative point of view. One hundred and twenty-two have recovered so as to return to their families and business. Others have left us improved or otherwise, who, had they remained longer, would have increased the number of cures. Some of those transferred by the Governor had been with us only a few days.

Among the "harmless and incurable" are included a few State paupers that the Overseers of the Poor took directly to the State Almshouses, from one of which we have received others in return. Those we received from the State Alms-

house have appeared about as harmless as any patients we have. This has deterred me from advising and recommending others to you to be sent back to the towns as fit subjects for those institutions.

Probably in no part of the world are the causes of insanity more numerous and more active than among the population of Massachusetts. Here the mind, and body too, are often worked to the extreme point of endurance. Here wealth and station are the results of well-directed efforts; and the general diffusion of intelligence among the whole people stimulates a vast many of them to compete successfully for these prizes. But in the contest, where so many strive, not a few break down. The results on their minds may not, perhaps, be any less disastrous, whether wealth and station are obtained or not. The true balance of the mind is disturbed by prosperity as well as

adversity. It is only in a sound body that the manifestations of the mind are sane and entirely healthy. As a people, we cannot boast of the highest standard of physical health, although we may of general intelligence, enterprise and hard work.

In this table, the two hundred and ten that were transferred were not taken into the count. Had they been reckoned, the per cent. would have been different. For recent cases recovered, it would have been 66; for all discharged, 28; and for old cases, 12. The per cent. of deaths of all in the Hospital would have been 4.15; and of the average number, 7.9.

By the persevering efforts of the Assistant Physicians, Drs. Bemis and Smith, the patients have this year enjoyed, in walks, in amusements and freedom on their parole of honor out of doors, greater indulgence than ever before. They have been enabled to do so, in part, because the grounds this year about the building have been protected by fences for the first time. Intruders have been kept off, and our quiet people could sit and stroll about this hill pleasant days unmolested. Far less mechanical restraint has been used than was formerly deemed absolutely necessary. Amusements of various kinds, as walking, riding, working, reading, writing, music and games, have been put in requisition to arouse the listless minds of the inactive, and to bring into a healthy channel the wandering thoughts of the deluded.

We are under great obligation to the proprietors for the following periodicals, for which we can make them in return only this acknowledgment, and express the gratitude of our patients who are made happy in their perusal: The Daily Advertiser, Evening Gazette, Olive Branch, Puritan Recorder, Christian Witness, Church Advocate, Youth's Companion, Monthly Religious Magazine, Zion's Herald, New England Farmer, Prisoner's Friend, from Boston; Register, Essex County Gazette and Advertiser, from Salem; Old Colony Memorial, Plymouth; Lynn News, Lynn; Assistant of the Ministry at Large, Roxbury; Gospel Messenger, Utica, N. Y.; Democrat, Taunton; Ægis, Spy, Palladium and Journal, Worcester; Courant, Clinton; and some papers and books from several friends of the Hospital.

The stated daily and weekly religious services here have been continued by the able Chaplain who has so long been with us. These services, besides promoting something of religious growth in the hearts of all, are among the moral means by which the insane as well as the sane become habituated to

\$3,733 78

the rules of order and decorum. Former associations are awakened in their minds, which allay the restless feelings of the insane, and help them to keep in subjection their wandering thoughts. They are the occasion of some happiness and activity on the Sabbath, and they mark the hour of repose at night.

The patients assist in the various departments of the Hospital, and their services are valuable for what they perform, and still more valuable in its effects upon their own health. Some thirty have regular daily duties assigned them out of the wards; and, when there is any extra job on hand, as many more are often taken out into the fields and shops by the several assistants. The attendants are assisted in the wards, in the care of them, in sewing and knitting, by a hundred or more of the patients. But still there is a great want here of some kind of mechanical labor, at which considerable numbers could be engaged without danger to themselves, that would be both healthful and pleasant in its performance.

The farm and garden have yielded full returns for the labor bestowed, as the following estimate of the crops by the Steward will show:—

App	les, 95 bushels at 40c.,	•		•	•	•		\$38	00
Chei	ries, 20 bushels at \$2.00),	•		•	•		40	00
Corr	n, sweet, in ears, 80 bush	els	at 50c.	,	•	•		40	00
Bear	ns, 7 bushels at \$2.00,	•	•	•	•			14	00
	es, 162 bushels,							40	50
	bage heads, 1,800 at 5 ce					•		90	00

Peas	s, 30 bushels at \$1.00,	•			•			30	
	$41,050$ quarts at $3\frac{1}{2}c.$	•			•		1	,436	75
	f, 8,434 lbs. at 7c., .				•			590	
Pork	x, 14,578 lbs. at 8c., .				•		1	,166	
	ltry, 150 lbs. at 10c.,	•			•			•	

And for wintering or fattening the stock on hand, of 4 horses, 2 oxen, 24 cows and 122 swine:—

Hay, 44 tons at \$20.00, .	•	•	•		\$880 00
Rowen, 4 tons at \$15.00, .		•			60 00
Corn fodder,	•	•	•		15 00
Carrots, 1,600 bushels at 25c.,	•	•	•	6	400 00
					\$1,355 00

I cheerfully acknowledge the ready cooperation of the several persons employed in this institution in carrying forward the great purpose of this charity. The duties of those in the immediate attendance on the insane are perplexing, and often arduous, and, when faithfully discharged, can be fully remunerated only by an approving conscience. We have been fortunate in acquiring and sustaining a high tone of moral and intellectual excellence in the attendants and assistants.

Persons devoted exclusively to the care and attendance on the insane are:—

Males,	•	•	•	•	•	•	•	•	•	13
Females	,	•	•	•	•	•	•	•	•	18—31

Persons employed in the various departments to work with and give exercise to the insane are:—

Males, .	•	•	•	•	•	•	•	•	17
Females,	•	•	•	•	•	•	•	. •	18—35
									66

The term of their services varies from several causes. About one-third leave yearly. Some, from the length of time and their devotion to it, become identified with its reputation. Those best adapted to their stations generally remain longest.

To each of the members of your Board, who have been ever ready to advise and assist me, and who have been active and zealous in promoting the best interests of the insane, I am glad of this opportunity to express my obligations and my gratitude. The services of your Board have been rendered without pecuniary compensation, and visits of business to, and inspection of, the Hospital, by some or all of its members, have been frequent. The book of Monthly Visits shows that no month since the institution was opened has passed without a record of such a visit having been made. Thirty-seven times have you been at this Hospital the past year, besides your meetings of business elsewhere.

Most respectfully,

Your obedient servant,

GEORGE CHANDLER.

STATE LUNATIC HOSPITAL, WORCESTER, Mass., December 1, 1854.

DECEMBER, 1853.—METEOROLOGICAL OBSERVATIONS made at the State Lunatic Hospital, Worcester, Mass., Lat. 420 16' 17", Long. 710 48' 13".—Elevation, 536 feet.
